In case of doubt, please contact Bosch Thermotechnology Technical team.

All electrical work must be undertaken by a qualified competent electrician.

Please ensure that all equipment supplied is installed and commissioned inline with the design and guide lines.

This drawing has been simplified for clarity and only shows the product(s) main dimensions, hydraulic and/or electrical representation where applicable.

The drawing is not a full design drawing and should be seen as a proposal for the designer to consider in the final system layout. It is the ultimate responsibility of the design engineer to ensure the system works to the parameters specified by the end customer.

The PK Mod terminal 1 & 2 provides a 0/10VDC control signal to the pump. This converts the pump enable to a volt free contact. This combined with a permanent live supply to the pump, ensures long pump life with the boiler output.

The Pre-Fitted Module Power Connector allows the pump to be modulated in line and allows the pump to be modulated in line with the boiler output.
